

vLSO 0.1a - virtual LSO for FSX carrier operations

NOTE - this is an ALPHA version of the program - some functions still not implemented.

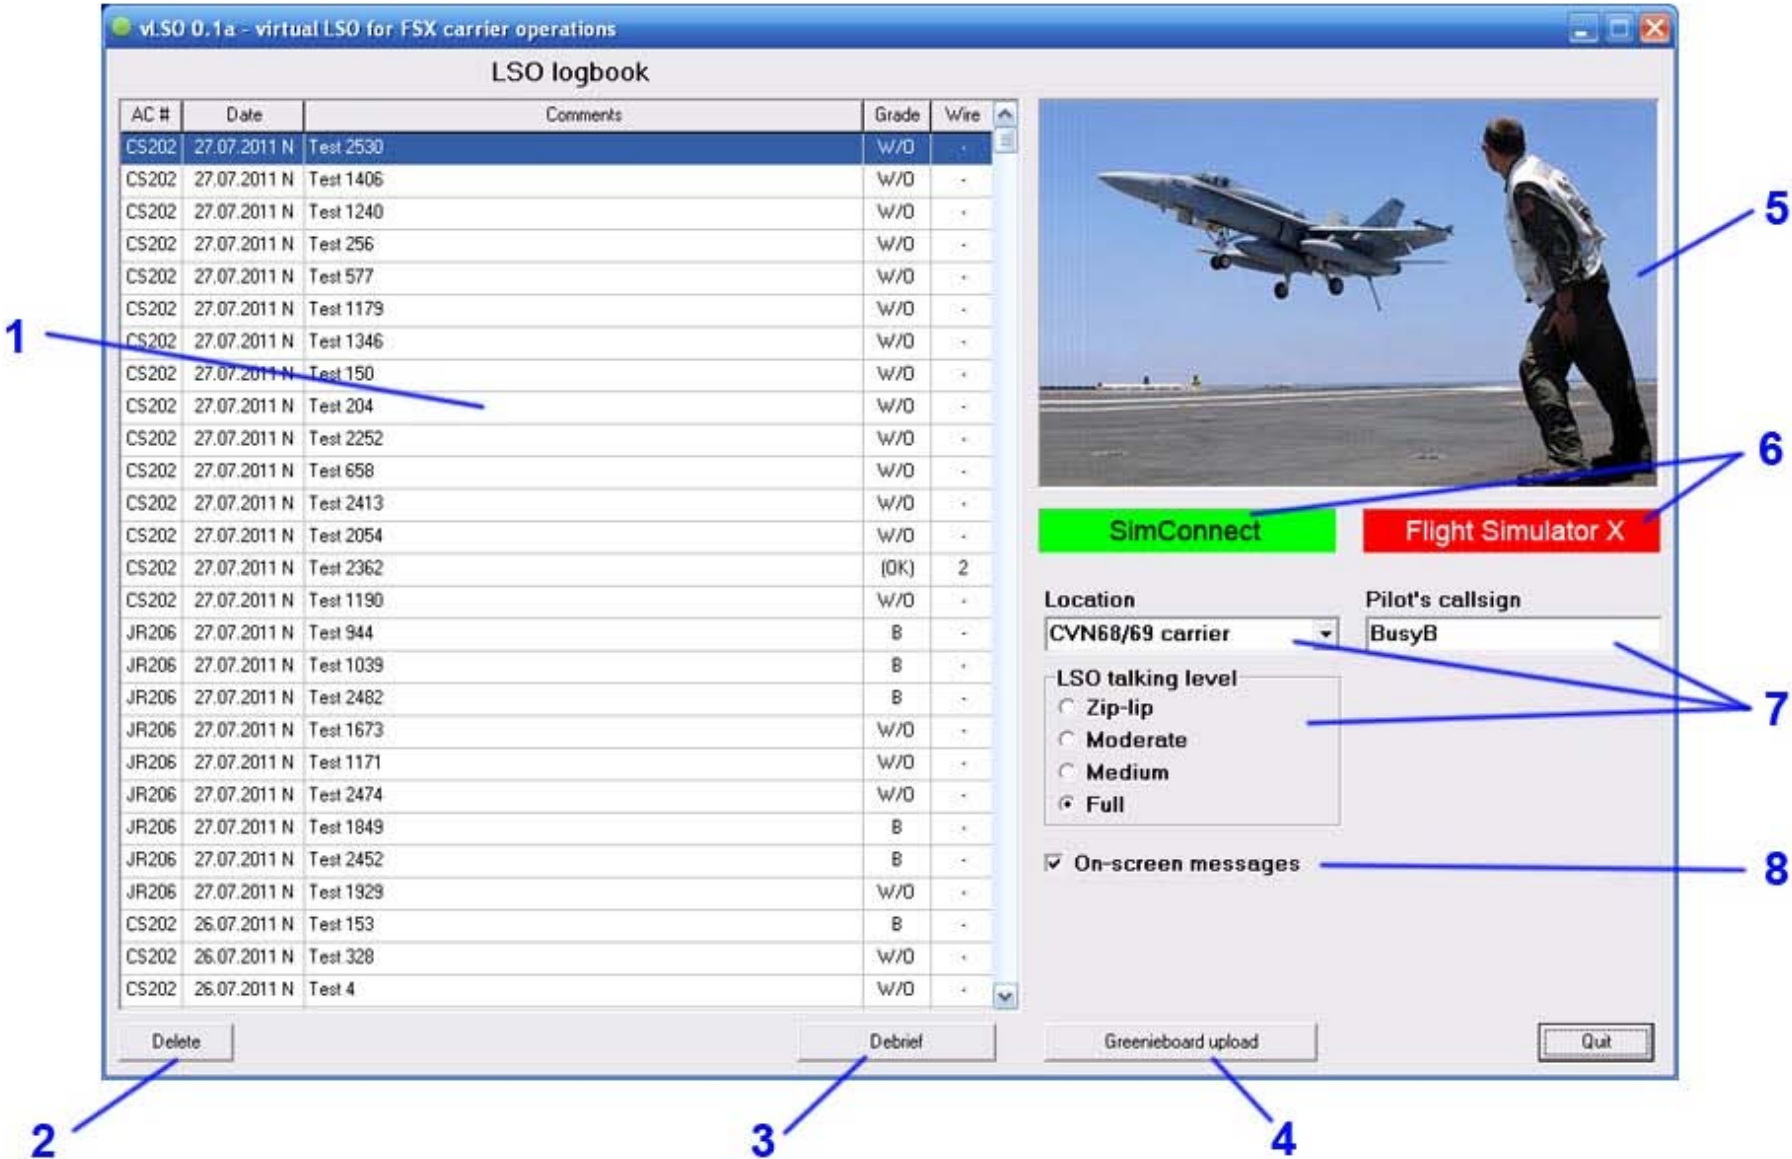

1. Installation / Deinstallation

To install just unzip and copy the vLSO folder to a folder of your choice. For your convenience you may create a shortcut to the vLSO executable file, i.e. vLSO.exe. To deinstall just remove the vLSO folder.

2. Using

Simply start the program. You can launch FSX before or after the vLSO, it doesn't matter - the vLSO itself takes care about connection and interaction with FSX.

Here's the program's main window explained:

1. LSO logbook - keeps LSO records
2. Delete button - deletes one or more logbook selected records
3. Debrief button - opens a debrief window
4. Greenieboard upload button - reserved for future development
5. A random LSO image
6. SimConnect and FSX status indicators - when both are green, the program is ready to monitor your approaches.
7. Location and Pilot's callsign - reserved for future development.
8. On-screen messages - controls whether to show or hide some LSO messages
